The specification describes a method for producing an extracellular matrix protein or its fragment. The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-cid, selected from the group consisting of trans-4-hydroxyproline and acid, into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional proteins depends on the post translational hydroxylation of proline. The proteins equence represents a chimeric collagen 1 (alphal)/bone present sequence represents a chimeric collagen 1 (alphal)/bone method is also nethod; be incorporated on the protein, which may be produced using the marphogenic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

A fusion protein (AAR89470) comprises the alpha-helical region of human collagen I(a) linked to the human mature transforming growth factor beta-1 (TGF-beta-1). It can be expressed in Eacherichia coli transformants carrying a vector incorporating a chimeric gene (AAT16516) coding for the fusion. The TGF-beta- molety increases efficacy of the body's normal soft issue repair response and also induces osteogenesis. The collagen moiety provides an integral substratum or scaffolding for the TGF and cells involved in reconstruction and growth. The fusion protein provides sustained release and delivery of TGF-beta-1 to a target tissue
                                                                                                                                                                                                                                                                                                                                           GSPGSPGPPGRTGPPGPAGEDGRPGPPGARGEAGVMGFPGPKGAAGEPGKAGERGVP 240

The extracellular matrix protein is capable of self aggregating in a cell which does not ordinarily hydroxylated prolines. The method comprises optimising a nucleic acid sequence for expression in the cell by substitution of codons preferred to sequence for expression in the cell by substitution of codons preferred by that cell for naturally occurring codons not preferred by the cell; incorporating the nucleic acid sequence into the cell; and contacting the cell with a hypertonic growth medium containing at least one amino acid, selected from the group consisting of trans-4-hydroxyproline and 3-codons into the cell and incorporated into the extracellular matrix protein. The method may be used to make host cells assimilate and incorporate trans-4-hydroxyproline into proteins. This is especially useful in the recombinant production of proteins such as collagen, fibrinogen and fibronectin whose ability to self aggregate and produce functional proteins depends on the post translational hydroxylation of proline. The method is also useful in studying the structure and function of proteins and is also useful in studying the structure and function of proteins depends which do not normally contain trans-4-hydroxyproline. The present sequence represents chimeric collagen 1 (alphal)/transforming contain trans-4-hydroxyproline contain the may be produced using the

Pancreatic cancer is a common cause of cancer death worldwide, therefore accurate methods of diagnosis and treatment are required. Compounds which modulate the proteins of the invention may have cytostatic activity and the protein and DNA sequences of the invention may be useful for the development of a vaccine or in gene therapy. The composition and methods are useful in diagnosing, staging, monitoring, preventing or treating pancreatic cancer
                                                                                                                                                                                                                                                                                   GVPGDLGAPGPSGARGERGFPGERGVQGPPGPAGPRGANGAPGNDGAKGDAGAPGAPGSQ

```
This invention relates to novel nucleic acids and proteins present in normal and neoplastic pancreatic cells. Pancreatic cancer is a common cause of cancer death worldwide, therefore accurate methods of diagnosis and treatment are required. Compounds which modulate the proteins of the invention may have cytostatic activity and the protein and DNA sequences of the invention may be useful for the development of a vaccine or in gene therapy. The composition and methods are useful in diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer and non-cancerous disease states of the pancreas. The present sequence is that of a human pancreatic protein of the invention.
                                                                                                                                                                                                                                            New pancreatic specific nucleic acid molecule or protein for diagnosing, staging, imaging, monitoring, preventing or treating pancreatic cancer connorcancerous disease states of the pancreas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        542 GSPGSPGPDGKTGPPGPAGQDGRPGPPGPPGPRGQAGVMGFPGPKGAAGEPGKAGERGVP

                                                                                                                                                                                                                                                                                                                                                                  740
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention provides a method for the production of fibrillar collagen. The method comprises: (a) culturing a recombinant host cell comprising a DNA encoding a fibrillar collagen monomer lacking a C propeptide SSAD (sequence selection and alignment domain); and (b) producing the fibrillar collagen. The methods are used to produce fibrillar collagen,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Fibrillar collagen; C propeptide; SSAD; telopeptide; gelatin; sequence selection and alignment domain; prosthetic implant; foodstuff;

It can be expressed in Escherichia coli transformants carrying a vector incorporating a chimeric gene (AAT16517) coding for the fusion. The decorin binds to type I collagen and thus affects Elbril formation. It inhibits the cell attachment-promoting activity of collagen and fibringen by binding to such molecules near their cell binding sites. The collagen moiety provides an integral substratum or scaffolding for the decorin. The fusion protein acts to reduce scarring of healing tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

from which telopeptide collagen fibrils can be derived. Host cells, comprising DNA encoding a collagen monomer lacking SSAD or N propeptide is used to produce gelatin. Collagen is used in biological research as a substrate for in vitro cell culture and as a component of biocompatible materials for use in prosthetic implants, sustained drug release matrices, artificial skin and wound dressing and healing devices. Gelatin is particularly useful for foodstuffs and medicine, for coating tablets and making capsules. The methods, comprising the use of collagen monomers parchet he N and/or C propeptides, result in a large increase in the production of type I collagen. The present sequence represents the human preproalpha 1 (1) collagen (GenBank Accn no: AF017178)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 9, Application US/09289578

Patent No. 6428978

GENERAL INPORMATION:
APPLICANT: Olsen, David R
APPLICANT: Chang, Robert
APPLICANT: Hitzeman, Romald A.
APPLICANT: Chisholm, George
TITLE OF INVENTION: NOVEL METHODS FOR THE PRODUCTION OF GELATIN AND
TITLE OF INVENTION: PULL-LENGTH TRIPLE HELICAL COLLAGEN IN RECOMBINANT
TITLE OF INVENTION: CELLS
FILE REFERENCE: 225002030400
CURRENT APPLICATION NUMBER: US/09/289,578
CURRENT FILING DATE: 1999-04-10
PRIOR FILING DATE: 1999-04-10
PRIOR FILING DATE: 1998-05-08
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          180

US-U8-468-996-10

Sequence 10, Application US/08468996

Patent No. 6645504

GENERAL INCORMATION:

APPLICANT: Weiner, Howard

APPLICANT: Weiner, Howard

APPLICANT: Weiner, Howard

APPLICANT: Weiner, Howard

APPLICANT: Ahmad, A-Leabbagh

TITLE OF INVENTION: BYSTANDER SUPPRESSION OF TYPE 1 DIABETES BY ORAL ADMINISTRATION OI FILE REPERRNCE: 1010/16959-U33

TITLE OF INVENTION: BYSTANDER: US 07/846,996

CURRENT APPLICANTION NUMBER: US 07/466,822

PRIOR PILING DATE: 1990-02-21

PRIOR PLILING DATE: 1990-02-21

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                         3070

FRIOR APPLICATION NUMBER: AU PR3116
PRIOR FILLING DATE: 2001-02-15
                                                                                                                                                         TOPOLOGY: unknown
MOLECULE TYPE: peptide
SEQUENCE DESCRIPTION: SEQ ID NO: 10:
NAME: STEEN, JEFFREY S
TELECOMONICATION INFORMATION:
TELEFRAX: (516) 228-8516
INFORMATION FOR SEQ ID NO: 10:
SEQUENCE CHARACTERISTICS:
LENGTH: 1388 amino acids
                                                                                                                           TYPE: amino acid
STRANDEDNESS: single
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GKEG 744

A;Note: the composition of peptides comprising residues 1-9 and 1-19 confirms the sequence A;Note: this region (residues 651-671 above) probably corresponds to positions 1032-1052 c;Comment: Prolines and lysines at the third position of the tripeptide repeating unit (c ed and subsequently 0-glycosylated.
C;Comment: The order of the nine CNBr peptides in the alpha 1(1) chain of rat skin collact C;Comment: The complete chain contains 1052 residues.
C;Superfamily: collagen alpha 1(1) chain; fibrillar collagen carboxyl-terminal homology; C;Reywords: blocked amino end (Glx) (probably pyrrolidone carboxylic acid) #statue F;1/Modified site: blocked amino end (Glx) (probably pyrrolidone carboxylic acid) #statue F;103/Modified site: sllyshine (Lys) #statue experimental
